# Motivation

- The progress of medical imaging techniques, blood flow modelling, and computational capacity allow us to consider the possibility of obtaining patient specific simulations.
- Numerical simulations must be reliable
- Important flow indicators as the Wall Shear Stress are highly sensitive to the geometry and the parameters in the model. But those are hard to “guess”!
- Missing link: use the available data to make simulations reliable...

# Theoretical Frame: Direct Problem

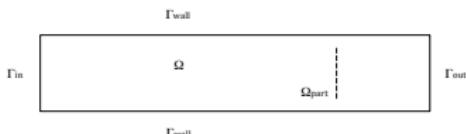

$$\begin{cases} -\nu \Delta \mathbf{u} + \mathbf{u} \cdot \nabla \mathbf{u} + \nabla p = \mathbf{f} & \text{in } \Omega, \\ \operatorname{div} \mathbf{u} = 0 & \text{in } \Omega, \\ \mathbf{u} = 0 & \text{on } \Gamma_{wall} \\ \mathbf{u} = \mathbf{g} & \text{on } \Gamma_{in} \\ \nu \frac{d\mathbf{u}}{dn} - \mathbf{n}p = 0 & \text{on } \Gamma_{out}. \end{cases}$$

## Definition

Let  $\mathbf{g} \in \mathbf{H}_0^1(\Gamma_{in})$ ,  $\mathbf{f} \in \mathbf{L}^{\frac{3}{2}}(\Omega)$ . We say that  $\mathbf{u} \in \mathbf{V}_{\Gamma_{wall}}$  is a weak solution of (NS) if  $\gamma_{\Gamma_{in}} \mathbf{u} = \mathbf{g}$  and

$$-\nu \int_{\Omega} \nabla \mathbf{u} : \nabla \mathbf{v} dx + \int_{\Omega} (\mathbf{u} \cdot \nabla) \mathbf{u} \mathbf{v} dx = \int_{\Omega} \mathbf{f} \mathbf{v} dx,$$

for all  $\mathbf{v} \in \mathbf{V}_D$ .

$$\mathbf{H}_0^1(\Gamma_{in}) = \left\{ \mathbf{v} \in L^2(\Gamma_{in}) \mid \nabla_s \mathbf{v} \in L^2(\Gamma_{in}), \gamma_{\partial\Gamma_{in}} \mathbf{v} = 0 \right\}$$

$$\mathbf{V}_{\Gamma_{wall}} = \left\{ \mathbf{v} \in H^1(\Omega) : \gamma_{\Gamma_{wall}} \mathbf{v} = 0, \operatorname{div} \mathbf{v} = 0 \right\}$$

$$\mathbf{V}_D = \left\{ \mathbf{v} \in H^1(\Omega) : \gamma_{\Gamma_D} \mathbf{v} = 0, \operatorname{div} \mathbf{v} = 0 \right\}$$

# Theoretical Frame: Direct Problem

## Theorem

Let  $g \in \mathbf{H}_0^1(\Gamma_{in})$  such that  $\|g\|_{\mathbf{H}_0^1(\Gamma_{in})} \leq \rho$ , for  $\rho > 0$  sufficiently small, and  $f \in \mathbf{L}^{\frac{3}{2}}(\Omega)$ . Then, there exists a unique weak solution  $u \in \mathbf{V}_{\Gamma_{wall}}$  of the Navier-Stokes eq which verifies

$$\|u\|_{\mathbf{H}^1(\Omega)}^2 \leq \alpha \left( \|g\|_{\mathbf{H}_0^1(\Gamma_{in})}^2 \right) + \|f\|_{\mathbf{L}^{\frac{3}{2}}(\Omega)}^2, \quad (1)$$

where  $\alpha(s) = c(s^2 + s)$ .

$$\mathbf{V}_{\Gamma_{wall}} = \{ \mathbf{v} \in H^1(\Omega) : \gamma_{\Gamma_{wall}} \mathbf{v} = 0, \operatorname{div} \mathbf{v} = 0 \}$$

$$H_0^1(\Gamma_{in}) = \{ v \in L^2(\Gamma_{in}) \mid \nabla_s v \in L^2(\Gamma_{in}), \gamma_{\partial\Gamma_{in}} v = 0 \}$$

[Guerra, Sequeira, Tiago, *Existence of optimal boundary control for the Navier-Stokes equations with mixed boundary conditions*, Port. Math, 2015].

# Theoretical Frame: Direct Problem - Some tools

- $H_{00}^{\frac{1}{2}}(\Gamma) = \left\{ g \in L^2(\Gamma) \mid \exists v \in H^1(\Omega), v|_{\partial\Omega} \in H^{\frac{1}{2}}(\partial\Omega), \gamma_\Gamma v = g, \gamma_{\partial\Omega \setminus \Gamma} v = 0 \right\}$

closed subspace of  $H^{\frac{1}{2}}(\Gamma)$ .

- The continuous embeddings  $H_0^1(\Gamma) \subset H_{00}^{\frac{1}{2}}(\Gamma)$  and  $H_{00}^{\frac{1}{2}}(\Gamma) \subset L^2(\Gamma)$

[R. Dautray, J. L. Lions, *Mathematical Analysis and Numerical Methods for Science and Technology*, 2000]

- Extension operator from  $\hat{H}^{\frac{1}{2}}(\Gamma_{in} \cup \Gamma_{out})$  to  $\mathbf{V}_{\Gamma_{wall}}$

$$\hat{H}^{\frac{1}{2}}(\Gamma_1 \cup \Gamma_2) = \left\{ (g_1, g_2) \in H_{00}^{\frac{1}{2}}(\Gamma_1) \times H_{00}^{\frac{1}{2}}(\Gamma_2) \mid \int_{\Gamma_1} g_1 \cdot n \, ds + \int_{\Gamma_2} g_2 \cdot n \, ds = 0 \right\}$$

## Lemma

Let  $(g_1, g_2) \in \hat{H}^{\frac{1}{2}}(\Gamma_{in} \cup \Gamma_{out})$ . Then there is a bounded extension operator  $E : \hat{H}^{\frac{1}{2}}(\Gamma_{in} \cup \Gamma_{out}) \rightarrow \mathbf{V}_{\Gamma_{wall}}$ ,   
 $\forall v \in \mathbf{V}_{\Gamma_{wall}}$ , such that for  $v = E(g_1, g_2)$  we have  $g_1 = \gamma_{\Gamma_{in}} v$ ,  $g_2 = \gamma_{\Gamma_{out}} v$ .

- Theorem proof: Fixed point argument + Estimates for Stokes solution

# Theoretical Frame: Control Problem - Existence Result

Minimize

$$J(\mathbf{u}, \mathbf{g}) = \beta_1 \int_{\Omega_{part}} |\mathbf{u} - \mathbf{u}_d|^2 dx + \beta_2 \int_{\Gamma_{in}} |\mathbf{g}|^2 ds + \beta_3 \int_{\Gamma_{in}} |\nabla_s \mathbf{g}|^2 ds$$

[ $\Omega_{part} = \cup_{i=1}^m S_i$  where  $S_i$  are cross sections of the “vessel” domain] subject to

$$\begin{cases} -\nu \Delta \mathbf{u} + \mathbf{u} \cdot \nabla \mathbf{u} + \nabla p = \mathbf{f} & \text{in } \Omega, \\ \operatorname{div} \mathbf{u} = 0 & \text{in } \Omega, \\ \mathbf{u} = 0 & \text{on } \Gamma_{wall} \\ \mathbf{u} = \mathbf{g} & \text{on } \Gamma_{in} \\ \nu \frac{d\mathbf{u}}{dn} - \mathbf{n}p = 0 & \text{on } \Gamma_{out}. \end{cases}$$

$$\mathbf{g} \in \mathcal{U}, \quad \mathbf{u} \in \mathbf{V}_{\Gamma_{wall}} = \{\mathbf{v} \in H^1(\Omega) : \gamma_{\Gamma_{wall}} \mathbf{v} = 0, \operatorname{div} \mathbf{v} = 0\}$$

$$\mathcal{U} = \left\{ g \in H_0^1(\Gamma_{in}) \mid \|g\|_{H_0^1(\Gamma)} \leq \rho \right\} \subset \mathcal{U}_0$$

$$\mathcal{U}_0 = \left\{ g \in H_0^1(\Gamma_{in}) : \text{s.t. NSEq have a unique weak solution} \right\}.$$

[Guerra, Sequeira, Tiago, *Existence of optimal boundary control for the Navier-Stokes equations with mixed boundary conditions*, Port. Math, 2015].

# Theoretical Frame: Control Problem - Tools

## Direct Method of the Calculus of Variations

- Non-emptiness of admissible set
- Compactness of minimizing sequences
- $J$  is weakly l.s.c (we need to check continuity and convexity properties)

# Numerical Approach - Discretization

- Discretize then Optimize approach -
  - Discretize using Finite Element Methods + GLS stabilization:

Minimize

$$J(\mathbf{u}, \mathbf{g}) = \beta_1 \int_{\Omega_{part}} |\mathbf{u} - \mathbf{u}_d|^2 dx + \beta_2 \int_{\Gamma_{in}} |\nabla_s \mathbf{g}|^2 ds$$

subject to

$$\left\{ \begin{array}{ll} -\operatorname{div}(\tau(D\mathbf{u})) + \mathbf{u} \cdot \nabla \mathbf{u} + \nabla p = \mathbf{f} & \text{in } \Omega \\ \operatorname{div} \mathbf{u} = 0 & \text{in } \Omega, \\ \mathbf{u} = 0 & \text{on } \Gamma_{wall} \\ \mathbf{u} = \mathbf{g} & \text{on } \Gamma_{in} \\ (-p\mathbf{l} + 2\nu(\dot{\gamma})D\mathbf{u}) \cdot \mathbf{n} = 0 & \text{on } \Gamma_{out}. \end{array} \right.$$

## Numerical Approach - Discretization

- Discretize then Optimize approach -
  - Discretize using Finite Element Methods + GLS stabilization:

Minimize

$$J(U, G) = \beta_1 \langle U - U_d, M(U - U_d) \rangle_{N_u} + \beta_2 \langle G, NG \rangle_{N_g}$$

subject to

$$\begin{cases} \mathbf{Q}(U) + \mathbf{N}(U)U + B^T P = F(U) \\ BU = 0. \end{cases}$$

$$U = U(G)$$

## Numerical Approach - Discretization

- Discretize then Optimize approach -
  - Discretize using Finite Element Methods + GLS stabilization:

the diffusion term:

$$\int_{\Omega} \nu \nabla \mathbf{u}_h : \nabla \mathbf{v}_h + \sum_{K \in \tau_h} \int_K -\nu \Delta \mathbf{u}_h \cdot \varphi(\mathbf{u}_h, \mathbf{v}_h).$$

the convective term:

$$\int_{\Omega} ((\mathbf{u}_h \cdot \nabla) \mathbf{u}_h) \cdot \mathbf{v}_h + \sum_{K \in \tau_h} \int_K ((\mathbf{u}_h \cdot \nabla) \mathbf{u}_h) \cdot \varphi(\mathbf{u}_h, \mathbf{v}_h).$$

$$\varphi(\mathbf{u}_h, \mathbf{v}_h) = \delta((\mathbf{u}_h \cdot \nabla) \mathbf{v}_h + \nu \Delta \mathbf{v}_h).$$

[Bazilevs, Hughes, et al, *Int. J. Numer. Meth. Fluids*, 2007]

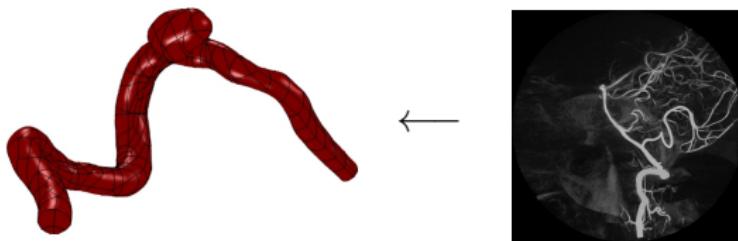

## Numerical Approach- Optimization

- Solve the Nonlinear Mathematical Programming (NMP) problem
  - Use Sequential Quadratic Programming (in SNOPT - Sparse Nonlinear Optimization + SQOPT)

$$\begin{cases} \min_g Q(u(g), g) \\ L(u(g), g) = 0 \\ l_1 \leq G(u(g), g) \leq l_2 \end{cases}$$

[Gill, Murray, Saunders, *Siam Review*, 2005]
